I build multimodal ML systems end to end for domains where expert labels are scarce: foundation models as annotators, self-supervised pretraining, explainable predictions, and national-scale inference evaluated under distribution shift. At MIT and Microsoft Research, I have applied them to high-stakes problems in health and food security: screening for COVID-19 and Alzheimer's from coughs and speech, and mapping crops across entire countries. I lead research on evaluation science for geospatial foundation models. I have mentored student researchers for over three years. PhD expected February 2027; seeking research and applied scientist roles, open to forward-deployed and research-product work.

EXPERIENCE

MIT Earth Intelligence Lab · PhD candidate (advisor: Prof. Sherrie Wang) Sep 2022 – present

- **National crop-type map of India** (first author, manuscript in preparation). Built a VLM data engine: Gemini 3.1 Pro generated 728,490 crop labels from street-level images (90.2% agreement with agronomists, six classes). These labels distil the VLM into a classifier on frozen AlphaEarth embeddings that maps every 10 m pixel of India at 77.1% overall accuracy (eight classes) on expert-labelled test points.
- Chose the embedding classifier for inference cost: national inference in under 4 hours on Earth Engine, versus an estimated 1–2 years for a time-series CNN (85.1% on the same test set).
- **Thailand crop-type map** (first author, AAAI 2024). GPT-4V zero-shot labels on Google Street View images replaced field surveys and expert annotation as the training signal: the resulting map reaches 92% accuracy, within one point of the expert-supervised map (93%).
- **Benchmark reliability for geospatial foundation models**. Leading research on whether Earth-observation benchmarks separate foundation models (Panopticon, AnySat, DINOv3, DOFA, ScaleMAE) by more than seed noise, and whether model rankings hold across tasks and training-set sizes.
- Mentored three student researchers.

Microsoft Research · Research intern, Seattle May 2024 – Aug 2024

- **Self-supervised multimodal foundation model** for radar, optical and land-cover satellite time series, working with the AI for Agriculture and AI for Industry teams. Designed the encoder architecture, built its 20 TB data-streaming pipeline, optimised its throughput and ran distributed multi-GPU pretraining.

EY-Parthenon · Strategy consulting intern, Geneva Sep 2021 – Jan 2022

- Built a playbook of technology-led sustainability strategies for consumer-goods, retail and agribusiness firms.

MIT Auto-ID Lab · Research assistant (supervisor: Dr. Brian Subirana) Feb 2020 – Sep 2021

- **COVID-19 screening from phone-recorded forced coughs** (first author, IEEE OJEMB 2020; 700+ citations): AUC 0.97, with 98.5% sensitivity at 94.2% specificity, on the official-test subgroup of a 5,320-subject dataset. A 2024 independent study (Coppock et al., *Nature Machine Intelligence*) found that recruitment bias in crowdsourced audio can inflate such results.
- **Alzheimer's screening from spontaneous speech** (first author, Frontiers in Computer Science 2021): the same acoustic-biomarker encoders reach 93.8% accuracy on the ADReSS test set from raw audio. Both models output per-patient saliency maps that track progression over time.
- Set up clinical data collaborations with the Government of Catalonia's Department of Health (Spain) and the Universidad de Guadalajara (Mexico) for forced-cough recordings from PCR-tested patients.

Earlier Sep 2017 – Jan 2020

- Data scientist, Nutrino Health (later acquired by Medtronic): improved a food-image classifier with weak labels.
- Lead data scientist, ADLA (start-up): built a computer-vision recommendation chatbot.
- Lead software engineer, InAGlobe Education: co-built a student–NGO technical-project matching platform.

EDUCATION

MIT · PhD, Electrical Engineering and Computer Science — Sep 2022 – Feb 2027 (expected)

Cornell Tech · MEng, Computer Science · merit scholarship — Sep 2020 – May 2022 (leave of absence, fall 2021)

Imperial College London · BEng, Electronic and Information Engineering — Oct 2016 – May 2019
Specialization in machine learning

SKILLS

Machine learning	Multimodal learning, foundation models, vision-language models, VLM data engines and model-generated supervision, self-supervised pretraining, cross-modal distillation, evaluation science and benchmark reliability, distribution shift, explainability, national-scale inference, computer vision, remote sensing and satellite time series, audio and speech
Tools	Python, PyTorch, TensorFlow, Google Earth Engine, Vertex AI and Google Cloud, distributed multi-GPU training, high-throughput data streaming, SLURM, SQL, C/C++
Languages	Catalan, Spanish, English, French
